

GenAI & Development Basics - Starter Notes

1. JDK (Java Development Kit)

JDK is a software package used to develop, compile, and run Java programs. It includes JRE, JVM, and compiler tools.

2. VS Code

VS Code is a lightweight code editor used for writing and debugging code across multiple programming languages.

3. GitHub & GitHub Copilot

GitHub is a platform for storing and managing code using version control. GitHub Copilot is an AI assistant that helps write code faster.

4. Postman

Postman is a tool used to test APIs by sending requests and receiving responses from servers.

5. Node.js

Node.js allows running JavaScript outside the browser, mainly used for backend development.

6. Markdown (.md files)

Markdown files are used for formatting documentation in a simple, readable way.

7. PyTest

PyTest is a Python framework used to test code and ensure it works correctly.

8. Python

Python is a simple and powerful programming language widely used in AI, ML, and automation.

9. JSON

JSON is a lightweight data format used for data exchange between systems and APIs.

10. Key Concepts

Machine Learning learns patterns, Deep Learning uses neural networks, and Generative AI creates new content. LLMs are a type of GenAI used in tools like ChatGPT.
